Re: Ball Check Valve Coated Springs

Effective immediately, Asahi/America has changed the coating material on our 316 stainless steel ball check springs from PTFE to black halar[®]. This change provides excellent chemical resistance and improved durability over previous PTFE blend coating. A uniform smooth black finish on the spring is to be expected. This change only applies to the coated springs offered. Standard springs remain 316 stainless steel. The coated spring utilizes the standard 316 stainless steel spring with the black halar[®] powder topcoat electrostatically applied and thermally cured.
